

BEAT THE SUMMER HEAT

QUICK TIPS FROM
EASLEY COMBINED UTILITIES

ADJUST YOUR THERMOSTAT

Keep in mind that a setting of **78 degrees** (or higher when you are not at home) can dramatically reduce energy use.

If you can handle warmer temperatures indoors, do it!

The smaller the difference between the temperature on your thermostat and the outdoor temperature, the lower your cooling costs will be.

FANS ARE YOUR FRIENDS

Switching your fans to **rotate counterclockwise** allows cool air to circulate without lowering the thermostat.

Turning on the ceiling fan in rooms you occupy can make any room feel about **four degrees cooler!**

When you leave a room, turn off your ceiling fans to avoid unnecessary electric consumption.

KEEP THE COOL IN & THE HEAT OUT

Seal cracks and add caulk or weatherstripping around windows (and doors).

Use **blinds** or **curtains** to prevent added heat from sunlight from warming your home up further.
